

## Case Study 13

# Privacy with an airy ambience

### *Project type:*

*Conference rooms, Cambridge*

### *Film types:*

*Opalux Privacy Screening Film*

Many companies need a secluded room where confidential business can be conducted in a quiet environment.

These conference rooms at a Cambridge technology centre gave this facility but lacked total privacy because visual contact could be made through the glazed partitioning around the perimeter of each room.

To overcome the problem once and for all, a privacy screening film with a finely textured translucent matt finish which stops visual contact has been installed on the face of the glazing. A clear strip has been left at intervals on each glazed panel to divide the area into smaller units and give just enough visibility to establish whether the room is occupied. Previous to installing the window film, vertical louvre blinds had been used on

the inside face of the partitions. During the working day, some of the rooms had their blinds closed while others had them open, giving the corridor an untidy appearance.

The use of the window film gives the partitions a uniform look and enhances the overall appearance, as well as providing privacy.

To personalise the glazing, the client's corporate logo was cut into the film before it was installed on the corridor doors.
